

CLAIMS

[1] An information display device, in which display media (particles or liquid powders) are sealed between opposed substrates, at least one substrate being transparent, and, in which the display media (particles or the liquid powders), to which an electrostatic field is applied, are made to move so as to display information such as an image, characterized in that spacers are arranged on a surface of at least one substrate in a sealing agent arranging portion, which seals a space between at least one flexible substrate and the other substrate by a sealing agent.

5 [2] The information display device according to claim 1, wherein the spacers are manufactured simultaneously when partition walls for forming cells between the substrates are arranged on the substrate.

10 [3] The information display device according to claim 1 or 2, wherein a total area of the spacers on the substrate is 0.5 - 50 % of the sealing agent arranging portion on the substrate.
